

METALTEC/ AEROSYSTEMS NEW JERSEY

EPA ID# NJD002517472

EPA REGION 2
CONGRESSIONAL DIST. 05
Sussex County
Franklin Borough

Site Description

The Metaltec/Aerosystems site is located on a 15 1/2-acre property in a rural residential area. It is the location of a former manufacturing facility that produced a variety of metal products. In 1980, the New Jersey Department of Environmental Protection (NJDEP) began sampling the facility's wastewater lagoon and surrounding soil as part of a site inspection. Results revealed the presence of volatile organic compounds (VOCs) and heavy metals. These contaminants leached from the lagoon into surrounding groundwater, and upon sampling residential wells, the State found VOCs at levels above Federal standards for drinking water. The Franklin Water Supply Well and contaminated private wells were closed in 1980, and affected residents were connected to the Borough's primary water supply. The site lies in a valley drained by a small unnamed stream that flows into Wildcat Brook, a tributary of the Walkill River. Franklin Pond lies 3/4 mile northeast of the site. The now-closed Franklin Water Supply Well, which served as a secondary water supply source, is about 400 feet east of the property. Approximately 4,000 people live within 3 miles of the site. Local surface water is used for recreation, fishing, and swimming.

Site Responsibility: This site is being addressed through Federal actions.

NPL LISTING HISTORY

Proposed Date: 12/01/82

Final Date: 09/01/83

Threats and Contaminants

Groundwater is contaminated with various VOCs and heavy metals. Potential health threats exist through the ingestion of contaminated groundwater.

Cleanup Approach

This site is being addressed in two long-term remedial phases, the first of which focused on source control of site contaminants and the second is addressing groundwater cleanup.

Response Action Status

Source Control: In 1986, EPA selected a remedy for cleaning up the sources of contamination at the site. The remedy featured: (1) excavating and treating 10,000 cubic yards of soils contaminated with VOCs in Parcel 1 and taking them off site for disposal at an EPA-approved landfill; (2) excavating 4,000 cubic yards of contaminated soils from Parcels 2, 3, and 4 and disposing of them off site at an EPA-approved landfill; (3) providing an alternate water supply for Franklin to replace lost drinking water capacity; and (4) studying the site further to identify the extent of groundwater contamination and to evaluate the best options for cleanup. In 1988, EPA excavated 5,000 cubic yards of soil from Parcels 2, 3, and 4, transported them to an approved landfill and backfilled the excavated areas with clean fill. An alternate water supply pipeline to provide water from two privately developed wells was completed in 1991. Cleanup of contaminated soils from Parcel 1, which was initiated in 1993, has also been completed.

Groundwater: In 1989, EPA completed a study of groundwater contamination at the site. A Record of Decision, signed in 1990, selected a remedy for the site which includes extracting the contaminated groundwater and treating it by air stripping to remove the VOCs. Any remaining organic contaminants will be removed by carbon adsorption. The treated groundwater will be discharged into the unnamed tributary of Wildcat Brook. The site will be monitored to ensure the effectiveness of the remedy. EPA is conducting extensive pre-design investigations which are complicated by the need for a larger treatment plant than originally anticipated and the presence of complex fractured bedrock and silt-filled caverns. Recently an endangered species of turtle was found at the site. EPA is cooperating with U.S. Fish and Wildlife Service to develop a plan to ensure that site activity will not impact the turtles. It is anticipated that the investigation and design work will be completed next year.

Cleanup Progress (Actual Construction Underway)

The source control actions and the completion of some cleanup measures described above have greatly reduced the potential for exposure to hazardous materials at the Metaltec/Aerosystems site while further cleanup activities are being planned and enacted. The site is currently undergoing a remedial design with installation of the remedial system scheduled for 2004.
